Retrospective study of the medical profile and clinical outcome of patients with thyroid-associated ophthalmopathy in Greece. To evaluate the clinical outcome of patients with Graves' disease and thyroid-associated ophthalmopathy (TAO) at the time of presentation and one year after the initiation of therapy. Prospective observational study of patients with Graves' disease and TAO diagnosed between January 2003 and December 2004 in a tertiary medical centre. Forty-eight patients diagnosed between January 2003 and December 2004 at the Thyroid outpatient clinic of the 2nd Department of Internal Medicine in the Medical School of National and Kapodistrian University of Athens were enrolled in the study. Patients were followed up for one year and evaluated by a multidisciplinary team of endocrinologists, ophthalmologists and rheumatologists at the beginning and at the end of the treatment. Patients were evaluated in terms of disease activity (thyroid-stimulating hormone (TSH) levels, TRAb, ophthalmopathy severity score (OSS), visual acuity), therapeutic response (response to treatment, relapse, mortality) and quality of life. Biochemical remission was achieved in 13 of 48 patients (27.1%) 1 year after the initiation of therapy. Relapse was observed in 9/13 (69.2%) patients in the remission group, and treatment was reinitiated in 8/13 (61.5%) patients. In the non-remission group, relapse was observed in 4/35 (11.4%) patients and treatment was reinitiated in 1/35 (2.8%) patient. There was no mortality. The results of the present study are encouraging in terms of disease remission, relapse and mortality during one-year follow-up, in patients with TAO. A further multicentre prospective study is needed to evaluate the long-term prognosis and clinical outcome of patients with TA
